Eudora Mail Very Slow FIX - it works 100%

Eudora is now abandoned ware so while it still exists the company no longer supports it and has tried to nobble it by corrupting a DLL file in it's still available download of Eudora 7.1. However with this you can get it for free, fix it by replacing the one DLL file and register it with the provided PRO serial and there you have it, it's yours legally! It so much better than Outlook and the best thing is that to back it up you just copy it's entire folder, move, reinstall as normal and then paste the copied folder over the new installation and your right to go, BRILLIANT!

REPAIRED DLL FILE

An exquisite, elegant, and simple solution to the problem. I had to overcome my aversion to using a text editor. I am just a simple user of Eudora, frustrated during the conversion to WIN 7 by the delay in check mail at startup. All the background posts are, i am certain, essential to those of you doing the problem solving. And, especially thank you to jhmeyers ("How to patch...") for developing a clear, understandable, and flawless "step-by-step" that I was able to follow very easily. I don't mean it to be condescending when I say "You communicate very well for a hacker!"

I was looking for a way to add tags to the thread which would have helped me find it through a search without jhmeyers' help. Tags I would add: checkmail, check, mail, startup, delay

Code:

```
http://eudorabb.qualcomm.com/showpost.php?p=46361&postcount=18
```

Code:

```
http://eudorabb.qualcomm.com/attachment.php?attachmentid=594&d=1276486442
```

Users of version 7.1.0.9 can overcome this even more easily,
by downloading the zip file attached to the prior post about hex editing,
which contains the already-patched **QCSSL.dll** file for version 7.1.0.9

The "fc /b" command mentioned in that prior post
may be used to compare the original file with the patched file,
to verify that only the correct single byte has been modified,
to make sure that no one has "hacked in" and substituted any malware.

Thank you for appreciating the technical writing;
it has only taken about four decades of continual practice 🙂

And thanks again to "JCF" (who figured out exactly what patch was needed,
by deep analysis of both OpenSSL source code and Eudora program modules).

Anyone can download this free fix right here...

QCSSL.v71.zip

http://eudorabb.qualcomm.com/attachment.php?attachmentid=594&d=1276486442

😲

*****ATTACHMENT DOWNLOAD HINT*****

The DLL file is in the pdf AND because the site does not allow me to upload a ZIP I have just changed the file type from ZIP to PDF but it really is not a pdf at all!

Just change it back to ZIP and then extract it...

Happily, Eudora 7.1.0.9 works fine with Windows Vista, 7 & 8 …

…and Qualcomm has graciously provided the following FREE code to unlock the full PRO mode without cost:

RegFirstNamePro = **Paid_Mode_No_Support**
RegLastNamePro = **Without_X1_Search**
RegCodePro = **4352-4846-7641-3881**

You may download Eudora from:

http://www.eudora.com/cgi-bin/export.cgi?productid=EUDORA_win_7109

🎲
« **Reply #2 on:** December 17, 2013, 12:25:10 AM »

Here is snapshots on how to modify QCSSL.dll yourself.

This patch is applicable only to recent versions of Classic Eudora for Windows (versions 6.2[.3?] thou experiencing the problem of a long delay upon the very first SSL connection to the very first SSL-ena perform the steps below. Some currently available, free hex editors for Windows:
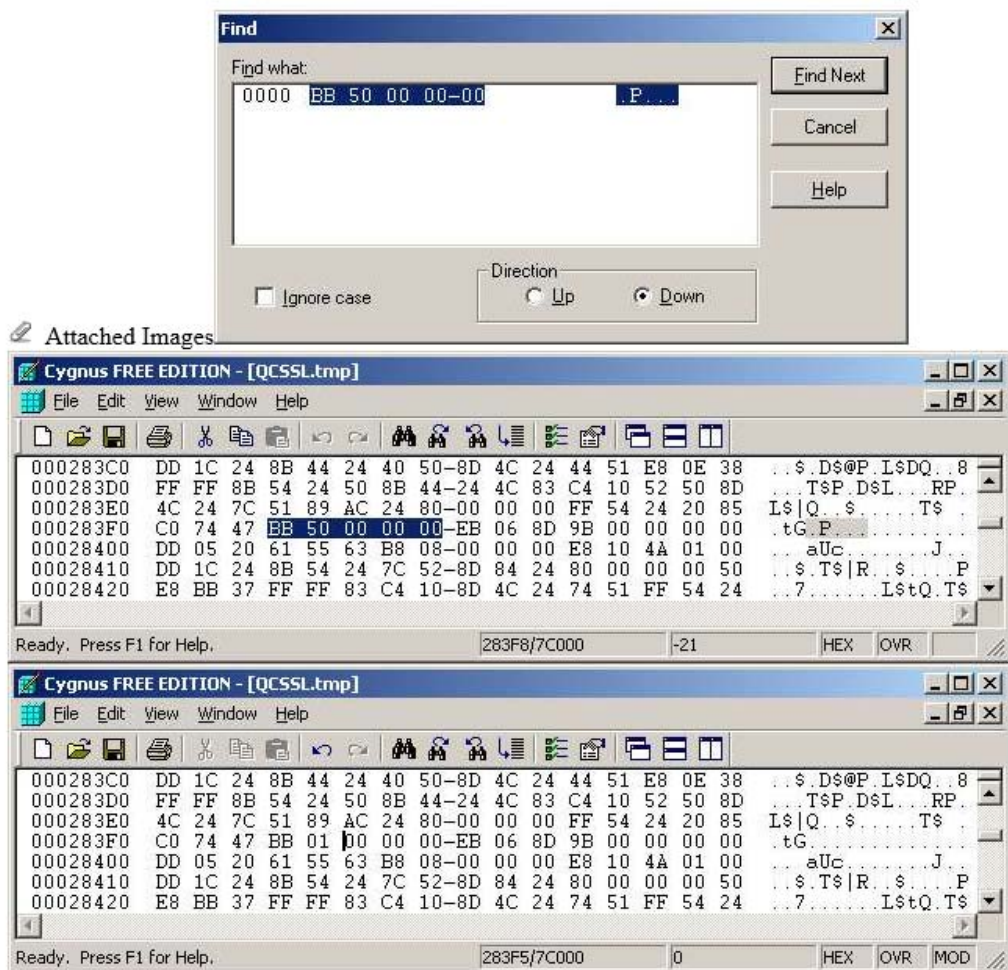

Cygnus Hex Editor Free Edition 1.00 http://www.softcircuits.com/cygnus/fe/

Frhed http://frhed.sourceforge.net/ Others: http://en.wikipedia.org/wiki/Comparison_of_hex_editors L program files (versions 6.2 through 7.1) The location of the program (application) folder is displayed shows where the "Application" path is found: http://eudorabb.qualcomm.com/showpost.php?p=44035 "Application" path to open the folder in Windows Explorer. Close the Eudora application before proce "QCSSL.dll" file by selecting it, then perform Ctrl+C (Copy) followed by Ctrl+V (Paste). Right-click "QCSSL.tmp" Right-click and open the "Properties" of "QCSSL.tmp" and clear any "Read-only" prop it to the shortcut for launching the editor, or to the already-open window of your editor, or use the "Fil steps below in the Cygnus hex editor mentioned above (other hex editors may differ slightly): Use "E BB 50 00 00 00 (just type the characters "bb50000000" and this editor will expand them) Repeat the s that there is only one location where this sequence is found. Type: BB01 (to overwrite "BB 50" with " that your typing wrote over the original bytes, and did not insert anything (the original "BB 50 00 00 (or abort. "Save" the correctly edited file. Make sure that the edited file and the original file are still the "Properties," and viewing the "Size" property (this may be different from "Size on disk") The correct 507,904 bytes An ideal way to check for proper editing is to open a "command prompt" (cmd.exe), gc edited files (usually C:\Program Files\Qualcomm\Eudora), then type and run the following command:

fc/b qcssl.dll qcssl.tmp

The correct output for Eudora version 7.1 is: Comparing files QCSSL.dll and QCSSL.TMP 000283F4 "50" to hex "01") After verifying proper editing, rename:

QCSSL.dll -> QCSSL.original QCSSL.tmp -> QCSSL.dll

Eudora is now patched, and should make the first SSL connection much faster. Thanks to "JCF" for th
